OPERATOR GUIDE

Transport Operations User Flows

The happy path from sales order to completed trip, plus Transport Manager configuration, for TAJ Transport Operations.

Odoo 19 | Module 19.0.1.11.1 | Dispatcher & Transport Manager | October 2026

Ground rule. Trips do **not** change Sales amounts, invoices, or Fleet master data. Commercial pricing stays on the Sales Order.

Roles and menus

Dispatcher

Day-to-day operations

- Create and fill trips
- Assign and replace resources
- Mark Ready → Start → Complete
- Record checkpoint arrival and departure
- Upload proof of delivery (POD)

Transport Manager

Everything a Dispatcher can do, plus

- Maintain catalogs: Cargo Types, Transporters, Route Templates, Checkpoint Types
- Skip checkpoints
- Correct recorded times
- Cancel an In Progress trip

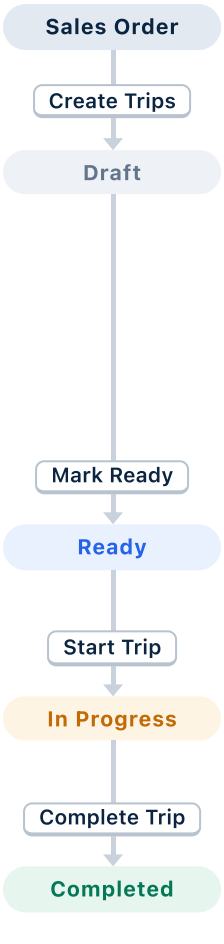

ACCESS

Users need the **Transport Operations** privilege (Dispatcher or Transport Manager). Sales users must be given that group separately to use trip buttons.

MAIN MENUS · TRANSPORT OPERATIONS

Trips	Milestones	Vehicle Availability	Configuration
List and open trips	All checkpoints, grouped by trip	Fleet vehicles: Assigned / Busy / Standby	Manager only: Cargo Types, Route Templates, Checkpoint Types, Transporters

Happy path (one trip)

Confirmed Sales Order with transport lines.

- Fill Commercial / Cargo / Route & Timing
- Check truck + driver (usually auto-assigned from Fleet)
- Optional: trailer / co-driver via **Replace Resources**
- Optional: route template → checkpoints on save

Cleared to run. Resources reserved; route template locked.

Record checkpoint **Arrival** → **Departure** as the trip runs.

Upload Proof of Delivery (anytime, including after completion).

Cancel (side path)

Draft Ready

Dispatcher or Manager: Cancel Trip + mandatory reason.

In Progress

Transport Manager only.

Completed Cancelled

Terminal. No reopen in this module.

STATE IS NEVER TYPED

Every state change goes through a header button. Each one checks its prerequisites (see step 5).

Step by step

1 Create the trip from Sales

→ Draft

1. Open a **confirmed** Sales Order with product/service lines.
2. Click Create Trips.
3. Review the suggested lines (truck-assigned lines are pre-suggested). Remove fee/non-transport lines. Add other transport lines if needed.
4. Optional: choose a **Route Template**. Each new trip gets its checkpoints (see step 4).
5. Click Create / Open Trips.

Each selected line gets **one** trip (`TRIP/<year>/<sequence>`), starting in Draft. A line that already has a trip reuses it.

AUTOMATIC RESOURCES

If the Sales truck is an active **Truck** with an active Fleet driver, and both belong to the trip's company or are shared, the trip is created with that truck and driver already assigned.

ALTERNATIVES

- On a line: `Trip` opens the existing trip or creates one for that line.
- On the order: the `Trips` smart button shows all linked trips.
- **Transport Operations** › **Trips** creates or opens trips directly (still needs a confirmed sales line).

NO VEHICLE ON THE ORDER

If no line has a vehicle, the wizard shows a yellow warning. You can still create Draft trips, or cancel and assign a vehicle on the order first.

2 Fill the Draft trip

Draft

Open the trip from **Transport Operations** › **Trips** or the Sales `Trips` button.

TAB COUNTERS

Tab labels show how many empty fields remain, for example **Cargo (3)**. The count includes read-only Sales fields and optional fields (trailer, co-driver, POD), so a non-zero count is normal. Use the header button `Fill Empty Fields` to fill only missing editable fields in one dialog.

TAB	WHAT TO DO
Commercial	Sales fields are read-only. Set **Transporter** (defaults to `TAJ` when that catalog entry exists) and an optional booking/transport reference.
Cargo	Sales cargo is read-only. Set **Cargo Type**, actual description and special handling.
Route & Timing	Set **Origin**, **Destination**, planned departure and arrival (arrival after departure). Optional route notes. If origin/destination are empty, `Fill Route from Product` can prefill them from the product name (Draft only); choosing a **Route Template** also fills them from the template.
Resources	See step 3.
Milestones	Optional; see step 4.
Proof of Delivery	Optional; usually after delivery.
Lifecycle	System timestamps, filled by the action buttons.

3 Assign resources

On **Resources**, check **Current Assignment** first. If the Sales truck met the Fleet condition in step 1, it and its driver are already there. If that is right, there is nothing to do here unless you need a trailer or co-driver (see **Replace later**).

IF CURRENT ASSIGNMENT IS EMPTY (DRAFT ONLY)

1. `Apply Fleet Defaults` is shown when the trip has a Sales truck. Use it after a Fleet user fixes the truck or its driver.
   Or open `Assign Initial Resources` and choose truck / driver / optional trailer / co-driver.
2. Enter the effective time (and optional location, reason, notes). Confirm `Assign Resources`.

FUTURE EFFECTIVE TIME
A future effective time blocks `Start Trip` until that time is reached.

You need at least one resource. Ready later requires an **active Truck** and a **primary driver**. Trailer and co-driver are optional.

REPLACE LATER

`Replace Resources` works on `Draft` `Ready` `In Progress` trips.

- Enter a new set, an effective time after the current assignment started and not in the future, and a reason.
- Change at least one resource. Ready and In Progress trips must keep a truck and primary driver.
- Use this to add a trailer or co-driver to an automatic assignment.
- History rows are never edited or deleted. The old period closes and a new one opens.

4 Optional: checkpoints from a route template

SET UP

1. Choose a **Route Template** (maintained by the Manager) in the `Create Trips` dialog, or on **Route & Timing** while the trip is Draft.
2. Save. The template's checkpoints are copied to **Milestones** as a snapshot; later template edits do not change this trip.
   `Generate Checkpoints` appears only if the template produced none (for example, it had no checkpoints when chosen).
3. Add one-off stops with `Add Checkpoint` if needed (any state before Completed / Cancelled).

Planning changes

`Draft only`

- Changing the template replaces the generated checkpoints; clearing it removes them. Manually added checkpoints stay.
- `Regenerate Checkpoints` rebuilds the generated checkpoints from the current template, picking up template edits.
- After `Mark Ready` the template is locked. Use `Add Checkpoint` for route changes.

Recording

`Ready` `In Progress` only

- Row `Arrival`: enter the time (defaults to now; no future times). The button also shows on Draft trips, but recording only works once the trip is Ready.
- Row `Departure` completes the checkpoint.
- Times must follow the checkpoint order.
- Open checkpoints do **not** block Ready, Start or Complete. `Complete Trip` lists them in the chatter.

TRANSPORT MANAGER
`Skip Checkpoint` or `Edit` (correct) recorded times with a reason. Skip is on the checkpoint's own form (open it from **Milestones**), for Pending checkpoints only. Edit also works after Complete, but not on a Cancelled trip.

5 Mark Ready → Start → Complete

Use the header buttons. State is never typed by hand.

ACTION	FROM	NEEDS / DOES
Mark Ready	Draft	Confirmed Sales Order; origin and destination; planned departure and arrival (arrival after departure); active assignment with Truck + primary driver.
Start Trip	Ready	Same planning/resource checks; assignment already effective; actual arrival empty. Stamps the started time; fills actual departure if empty.
Complete Trip	In Progress	Actual departure set; arrival after departure and not in the future. Stamps the completed time; fills actual arrival with now if empty; closes the active resource assignment.

AFTER COMPLETION

Current Assignment is empty; **Last Assigned Resources** and the full history remain. Operational commercial, cargo and route fields lock. POD can still be updated.

6 Proof of Delivery

On **Proof of Delivery**, upload the document or image and optional delivery notes. This is allowed after completion and never blocks Complete Trip.

Supporting flows

Vehicle Availability

Transport Operations › **Vehicle Availability** is a read-only list of all Fleet vehicles.

Assigned
Reserved on a Draft/Ready trip. A Draft trip with no assignment reserves its Sales truck.

Busy
On an In Progress trip. Busy wins if both apply.

Standby
Free.

It does **not** block double-booking; it is visibility only. Use Active Trips / Trips on a vehicle to open related trips.

Milestones menu

Transport Operations › **Milestones** shows the same checkpoints as the trip tab, grouped by trip by default. It shows the linked Sales Order and Customer for search and filtering.

Fill Empty Fields

The header button **Fill Empty Fields**:

- Edits only missing Commercial / Cargo / Route & Timing / POD fields (Route Template in Draft only).
- Does not overwrite existing values.
- Points Resources / Milestones / Sales gaps to the normal wizards or the Sales Order.
- On closed trips, offers only missing POD fields.

Transport Manager: configuration

All under **Transport Operations** › **Configuration**. Dispatchers select these values on trips; they do not maintain the catalogs.

Cargo Types

Categories used on the trip Cargo tab

- Create, edit and archive.
- Archiving keeps historic trips.
- Renaming a type that is already in use is blocked.

Transporters

Name (required) + optional email; used on the trip Transporter field

- A transporter still linked to a trip cannot be deleted.
- New trips prefer a transporter named **TAJ** (case-insensitive) when it exists.

Route Templates

Ordered checkpoints for a corridor; name unique per company

- Each line: name, optional type, planned offset in **days** and/or **hours** (hours are stored; days edit the same duration), optional coordinates (for a later phase).
- Dispatchers pick the template on a trip; generation copies a snapshot onto that trip.

Checkpoint Types

Labels such as Arrival at Site, Loading, Border Crossing

- The starter list is editable.
- A checkpoint can have no type.
- Renaming a type does not rewrite checkpoints that already stored their own “type at planning” snapshot.

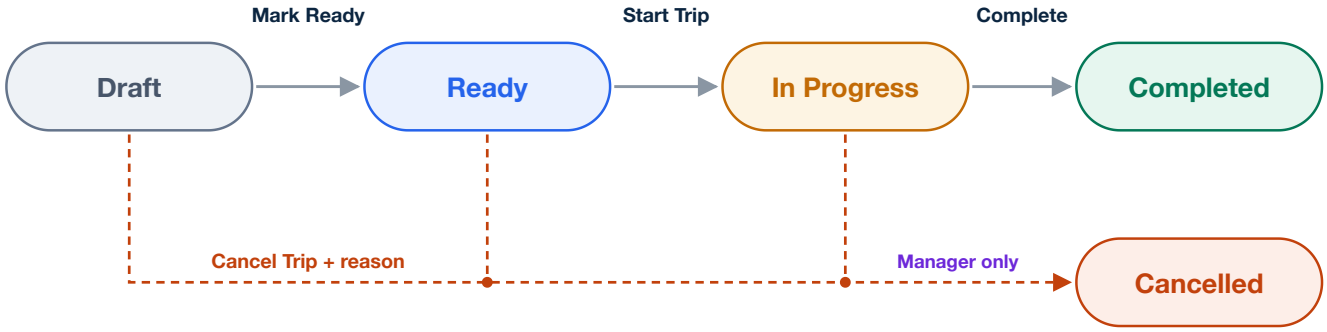

Manager-only trip actions

ACTION	WHEN
Skip Checkpoint	A Pending checkpoint that should not be recorded, on a Ready / In Progress trip (from the checkpoint form).
Edit on a milestone	Correct arrival/departure times (reason required; chronology re-checked). Also after Complete; not on Cancelled trips.
Cancel Trip while In Progress	Stop an active trip with a reason.

FLEET STAYS WITH FLEET

Fleet create/edit (trucks, trailers, categories) stays with **Fleet Officer / Administrator**. Transport roles get read access to vehicles for assignment; they do not get Fleet edit rights from this module.

Lifecycle at a glance

STATE	MEANING
Draft	Planning: fill route and cargo, check resources, optional checkpoints.
Ready	Cleared to run; resources reserved (Assigned); route template locked.
In Progress	Trip started; record checkpoints; resources Busy.
Completed	Done; resources released; POD optional.
Cancelled	Stopped with a reason; resources released.

For acceptance testing scripts, see `docs/TRANSPORT_FULL_UAT.md` and the related UAT docs.
